Customer Churn Prediction for Syriatel

Non-Technical Presentation

Prepared by : BRIAN AYIMBA

PURPOSE:

- Syriatel wants to reduce customer churn by identifying at-risk customers early.

PROJECT GOAL:

- Build a classification model to predict churn and guide retention strategies.

Business and Data Understanding

- Churn leads to revenue loss. Retaining customers is cheaper than acquiring new ones.

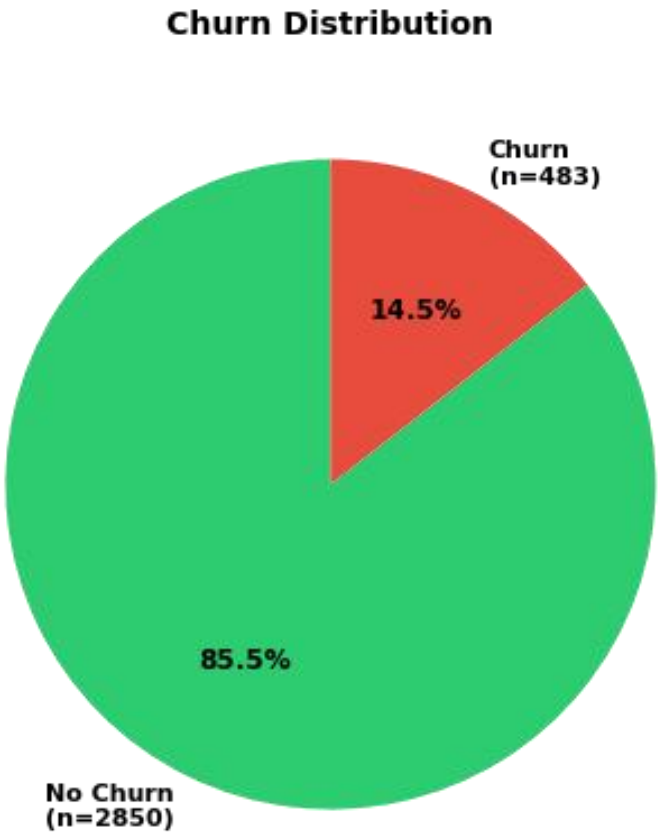
DATA SUMMARY;

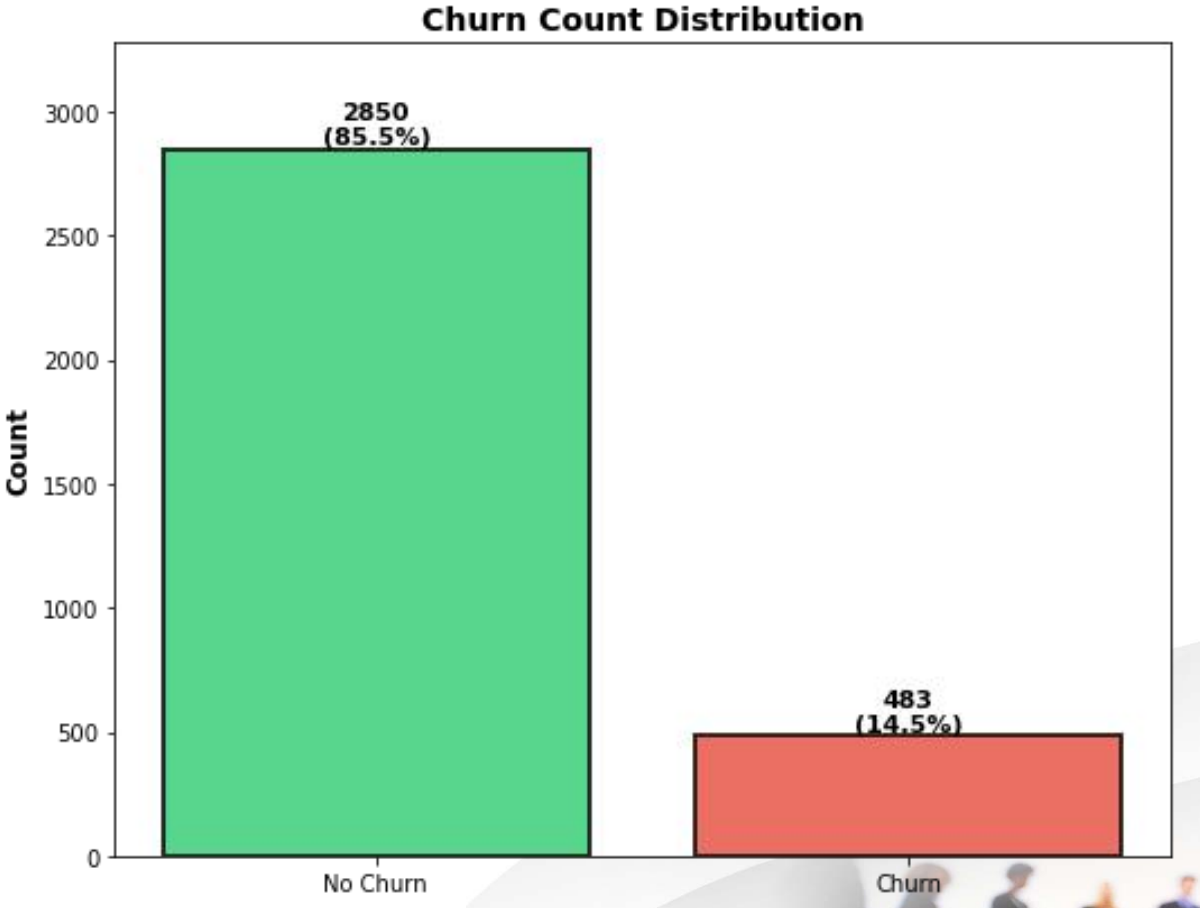
We analyzed Syriatel's customer records to understand churn patterns.

key features analysed;

- Tenure – how long a customer has stayed
- Contract type – monthly vs. yearly
- Usage patterns – call minutes, internet usage
- Customer service calls – number of complaints
- Churn label – whether the customer left or stayed

Churn distribution





Modelling Approach

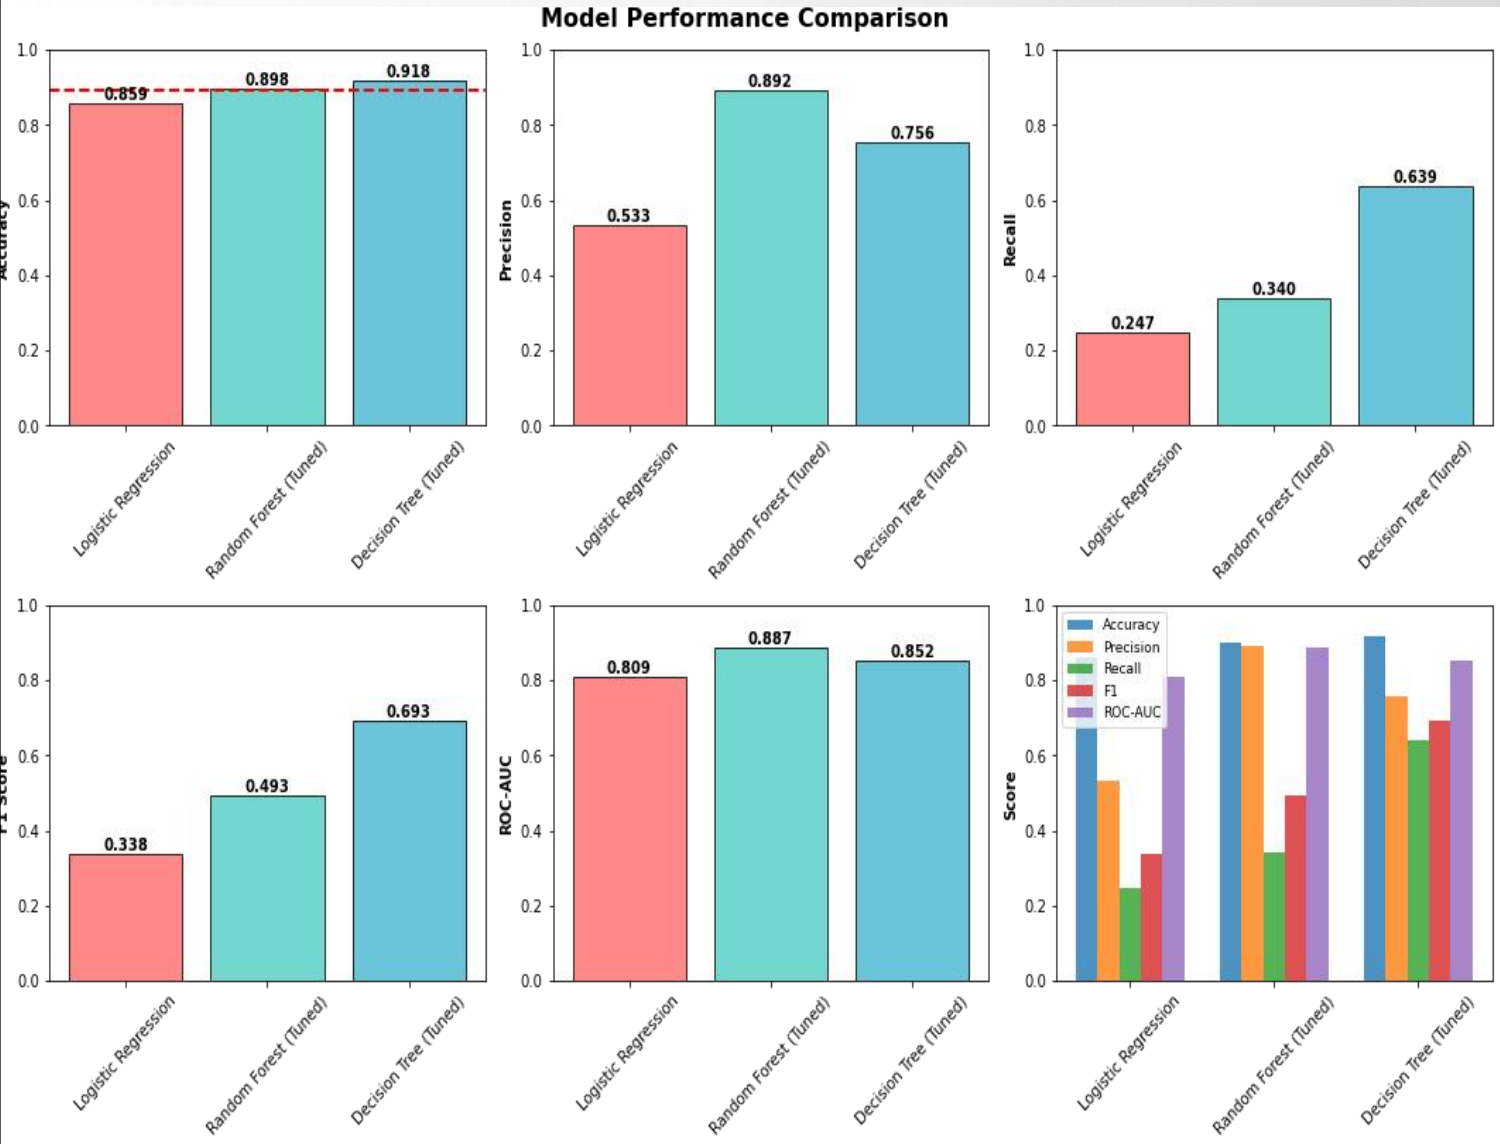
Models Compared:

- Logistic Regression
- Decision Tree
- Random Forest

WHY CLASSIFICATION?

We need to categorize customers as ‘likely to churn’ or ‘not likely to churn’.

Evaluation Mettrics



Accuracy ; how often the model is right
Precision ; how many predicted churns were correct
Recall; how many actual churns we caught

Recommendations

- Focus retention efforts on customers flagged by the model
- Use feature importance to tailor offers(eg. tenure,contract type)

Next Steps

- Deploy decision tree model(best performing) in production
- Monitor performance monthly
- Collect feedback from a newly formed retention team if not yet established

The END

THANK YOU.
